## DID YOU KNOW ?

- 363 high-risk vulnerabilities with a CVSSv3 score of 10.0 and Remote Code Execution (RCE) access were discovered in 2022.
- In 2021, it took companies an average of 193.1 days to fix a critical vulnerability. (Source: AppSec Stats Flash – Year in Review)

Penetration Testing, also known as Pen Testing, is a simulation of a real-world cyberattack. Penetration Testing-as-a-Service by TTR Technology helps you uncover vulnerabilities in your IT infrastructure by simulating both internal and external threats against your computer systems or networks. TTR Technology emulates the same tools, tactics, and methodologies used by real-world hackers. The key difference? While a genuine attack could cripple your business in minutes, TTR Technology's Penetration Testing identifies vulnerabilities in a safe, controlled environment—allowing you to fix issues before cybercriminals exploit them. The result is a detailed security report highlighting weaknesses, with actionable recommendations to enhance your security posture.

# TYPES OF PENETRATION TESTING SERVICES

**External Penetration Testing**

External testing focuses on securing internet-facing assets such as web, mail, and FTP servers. Since these are the most exposed parts of a company's infrastructure, attackers often target them first. TTR Technology's External Penetration Testing helps identify vulnerabilities in your public-facing systems, including enumeration and exploitation risks.

**Wireless Penetration Testing**

Unsecured wireless networks (Wi-Fi, Bluetooth) can serve as entry points for attackers.
TTR Technology conducts wireless penetration testing to detect vulnerabilities that could allow attackers to eavesdrop or infiltrate your network without detection.

**Mobile Application Penetration Testing**

As mobile device usage grows, so does the risk of vulnerabilities in mobile apps. A single flaw can expose user data and compromise your brand. TTR Technology provides comprehensive mobile app penetration testing to uncover security and privacy risks before they become liabilities.

**Internal Penetration Testing**

Internal threats—whether from malicious insiders or compromised internal access—can be devastating. TTR Technology's Internal Penetration Testing simulates these scenarios to assess how far an attacker could go within your internal network and what sensitive data they could access.

**Web Application Penetration Testing**

Web apps are a common attack vector. If exploited, they can give hackers access to databases, user info, and more. TTR Technology tests your web applications for OWASP Top 10 and other known vulnerabilities, ensuring your code and configurations follow best security practices.

**DoS and DDoS Simulation**

Denial-of-Service (DoS) or Distributed Denial-of-Service (DDoS) attacks can cripple your systems by overwhelming them with traffic. TTR Technology simulates these attacks to evaluate how your systems respond under pressure and helps you implement effective mitigation strategies.

**Social Engineering Assessment**

Humans are often the weakest link in cybersecurity. TTR Technology runs Social Engineering Assessments—like phishing simulations and behavioral testing—to evaluate employee awareness and strengthen your overall security posture.

# HOW OFTEN SHOULD YOU TEST YOUR IT INFRASTRUCTURE FOR VULNERABILITIES?

It is recommended to conduct penetration testing at least twice a year to stay ahead of evolving vulnerabilities and cyber threats. However, the frequency may vary based on several key factors:

- **Company Size** Larger organizations often have more complex systems, requiring more frequent testing to ensure comprehensive coverage.

- **Exposure to Attack Vectors** Companies handling sensitive data or operating in high-risk environments should conduct more frequent testing to reduce potential breach risks.

- **Industry Requirements** Regulated industries (like healthcare, finance, or government) may have compliance mandates that dictate specific testing intervals..

- **Infrastructure Complexity** The type, scale, and distribution of your IT infrastructure can influence how often vulnerabilities need to be assessed.

- **Regulatory Environment** Industry-specific regulations (e.g., HIPAA, PCI DSS, GDPR) may require quarterly or continuous assessments for compliance.

# ABOUT

TTR TECHNOLOGY

**TTR Technology's Penetration Testing-as-a-Service simulates real-world attacks to uncover hidden vulnerabilities in your systems, applications, and networks. Get actionable insights and strengthen your defenses. Reach out today to test and harden your security.**

## MISSION

TTR Technology delivers secure, reliable managed IT and cybersecurity solutions, helping businesses protect their data, streamline operations, and grow confidently.

## SOLUTIONS

- Innovation
- Support
- Reliability
- Innovation
